**Attachments:** Bee Jay Scalles Phase III RI ReportFinal\_optimized.pdf; Phase II RI Report\_final\_5-17-05.pdf; SecondHalf11GWSamplingReport\_BeeJayScales.pdf

I've attached three reports for the Bee Jay Scales site. You can find them all on Ecology's MTCA sites search pages:

<https://apps.ecology.wa.gov/gsp/CleanupSiteDocuments.aspx?csid=3641>

As discussed, there were several rounds of RI work and a substantial interim action prior to the final RI.

The 2,040 mg/L value was from vertical profiling tests of groundwater as described in the 2005 Phase 2 RI. Contaminant levels were different spatially at the 10 ft and 20 ft depths (see figures 4-5, 4-6 and 4-10). Permanent monitoring wells installed within the plume in that same report maxed out around 1,000 mg/L (MW 9) to 1,015 (MW 4).

Data from 2007 permanent wells were showing up to 859 and 984 mg NO<sub>3</sub>-N/L (wells MW 4 and MW 12) and 770 mg/L (MW 9).

Data from 2011 is a little lower following the interim action, at 648 and 790 mg/L (wells MW 4 and MW 12) and 445 mg/L (MW 9).
